

Q1) RDF (or) Semantic triples are an extension of graph DB of NoSQL data types

They provide a way to represent data in the semantic form of web

Every triple contains of 3 parts

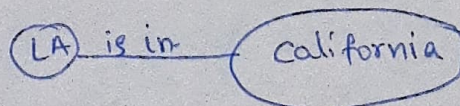

- 1) Subject: \rightarrow about what we are describing.
- 2) Object: \rightarrow its attributes
- 3) predicate: \rightarrow its values.

For example:

Los Angeles and San-Francisco are in California.

LA and California are subject and object respectively both are related as LA is in California.

another example can be
